

Acoustic Louvres

The GCS Acoustics Louvre has been designed to reduce noise levels when available area is restricted.

The compact design allows modern, streamline designs whilst still providing excellent acoustic properties.

The design prevents line-of-sight through the louvre which enhances its ability to reduce low frequency noise. The angled louvres are specifically designed to provide weather protection. Internal bird mesh can be provided to prevent the intrusion of vermin and birds.

Fabricated from galvanized sheet steel it offers a robust construction with various types of finishes if requested. Corrosive atmospheres can often require a more resilient construction therefore we can offer this design in a range of materials from Aluminium to Stainless Steel.

The modular design allows freedom for design and allows them to be used in most industrial or commercial applications.

For further advise on these products please contact GCS Acoustics Pty Ltd.
